## NCCN Guidelines Version 2.2022 Pancreatic Adenocarcinoma

[NCCN Guidelines Index](#)  
[Table of Contents](#)  
[Discussion](#)

### PRINCIPLES OF SYSTEMIC THERAPY

#### Adjuvant Therapy

- The CONKO-001 trial demonstrated significant improvements in disease-free survival (DFS) and overall survival (OS) with use of postoperative gemcitabine as adjuvant chemotherapy versus observation in resectable pancreatic adenocarcinoma.<sup>1</sup>
- ESPAC-3 study results showed no significant difference in OS between 5-FU/leucovorin versus gemcitabine following surgery. When the groups receiving adjuvant 5-FU/leucovorin and adjuvant gemcitabine were compared, median survival was 23.0 months and 23.6 months, respectively.<sup>2</sup>
- Data from ESPAC-4 support the use of gemcitabine combined with capecitabine (1,660 mg/m<sup>2</sup>/day days 1–21 every 4 weeks) with superiority demonstrated compared to gemcitabine alone (HR, 0.82; 95% CI, 0.68, 0.98; *P* = .032).<sup>3</sup>
- No significant differences were observed in the RTOG 97-04 study comparing pre- and post-chemoradiation 5-FU with pre- and post-chemoradiation gemcitabine for postoperative adjuvant treatment.<sup>4</sup>
- Recommended adjuvant therapy options apply to patients who did not receive prior neoadjuvant therapy. For those who received prior neoadjuvant therapy, the adjuvant therapy options are dependent on the response to neoadjuvant therapy and other clinical considerations.

#### Preferred Regimens

- Modified FOLFIRINOX (category 1)<sup>a</sup>
- Gemcitabine + capecitabine (category 1)

#### Other Recommended Regimens

- Gemcitabine (category 1)
- 5-FU + leucovorin (category 1)
- Continuous infusion 5-FU
- Capecitabine (category 2B)
- Induction chemotherapy (gemcitabine, 5-FU + leucovorin, or continuous infusion 5-FU) followed by chemoradiation<sup>b,c</sup>
- Induction chemotherapy (gemcitabine, 5-FU + leucovorin, or continuous infusion 5-FU) followed by chemoradiation<sup>b,c</sup> followed by subsequent chemotherapy:<sup>4</sup>
  - ▶ Gemcitabine followed by chemoradiation<sup>b,c</sup> followed by gemcitabine
  - ▶ Bolus 5-FU + leucovorin followed by chemoradiation<sup>b,c</sup> followed by bolus 5-FU + leucovorin
  - ▶ Continuous infusion 5-FU followed by chemoradiation<sup>b,c</sup> followed by continuous infusion 5-FU

#### Useful in Certain Circumstances

- None

<sup>a</sup> FOLFIRINOX or modified FOLFIRINOX should be limited to those with ECOG 0-1.

[Discussion](#)

### RESECTABLE DISEASE TREATMENT

<sup>k</sup> High-risk features include imaging findings, very highly elevated CA 19-9, large primary tumors, large regional lymph nodes, excessive weight loss, extreme pain.

<sup>m</sup> There is limited evidence to recommend specific neoadjuvant regimens off-study, and practices vary with regard to the use of chemotherapy and chemoradiation.

### BORDERLINE RESECTABLE DISEASE NO METASTASES

<sup>m</sup> There is limited evidence to recommend specific neoadjuvant regimens off-study, and practices vary with regard to the use of chemotherapy and chemoradiation. [See Principles of Systemic Therapy \(PANC-F\)](#) for acceptable neoadjuvant options. Subsequent chemoradiation is sometimes included; [see Principles of Radiation Therapy \(PANC-G\)](#). Most NCCN Member Institutions prefer neoadjuvant therapy at or coordinated through a high-volume center.

# NCCN Guidelines Since 2019

Germline testing is recommended for any patient with confirmed pancreatic cancer, using comprehensive gene panels for hereditary cancer syndromes

# ***BRCA1/2* Mutations in Pancreatic Cancer**

- Germline *BRCA1* or *BRCA2* mutation observed in 5-7%
- **More importantly, up to 40% of patients who are germline *BRCA1/2* gene mutation positive do NOT have a family history**

# DNA damage response and repair (DDR) Genes in Pancreas Ca

- 17 – 25% of pancreatic adenocarcinomas harbor mutations in the DDR genes
  - *BRCA1, BRCA2, ATM, PALB2, ATRX, RAD51...*

# DDR genes and Treatment Selection in Pancreas Cancer

- DDR mutated Met Pancreas Ca, platinum-based chemo may improve outcomes (RR, PFS, and OS)

*Pishvaian, et al, JCO Precision Oncology, October, 2019*

# POLO: Phase 3 international PARPi maintenance study in gBRCA mutated patients

NCT02184195

# Primary Endpoint: Blinded Central Review

# POLO: Final OS

# Know Your Tumor Registry Trial

## Advanced setting

- Post at least 2 lines
- **mOS**: Time from initiation of second line treatment
  - Matched treatment: **1.81 y**
  - Unmatched: **0.85 y**
  - No match: **0.73 y**
- **mPFS**: Only one line of treatment with best outcome
  - Matched treatment: **10.93 mo**
  - Unmatched: **4.53 mo**
  - No match: **5.37 mo**

OS

PFS

## **NTRK, NRG (Neuregulin) 1, RET Fusions, BRAF mutation**

- Entrectinib: case reports in patients with NTRK and ROS fusion
  - Pishvaian, et al, JCO-PO, 2018
- Pan-HER inhibitors (afatinib) and HER2-3 inhibitors (seribantumab or zenocutuzumab) NRG 1 Fusions. Responses in case reports
  - Jones MR, et al. Clin Cancer Res 2019;25:4674–81
- RAF alterations 2.2% (84 of 3,781) in large retrospective series.
  - BRAF/MEK/ERK inhibitors active in V600 subgroup, fusions, and Exon 11 mutations
    - Hadifar a, et al JCO PO no. 5 (2021) 1325
- Pralsetinib (BLU-667) RET fusion-positive tumors.
  - Subbiah V, et al,, J Clin Oncol 39, 2021 (suppl 3; abstr 467)

# KRYSTAL-1: Adagrasib (MRTX849) unresectable or metastatic pancreatic cancer and other gastrointestinal tumors with KRASG12C mutation

## Best tumor change from baseline (evaluable patients)

## KRAS G12D

- MRTX 1133 shows promise in targeting and inhibiting KRAS G12D activation
  - Trials Underway
- Agents under development targeting G12R, G12V, G12A, G12S, G13D

# **IMMUNOTHERAPY**

# Checkpoint Inhibitors

- Pembrolizumab in MSI-high disease
- Response or SD in 6 out of 6 patients

# CONCLUSIONS

- Systemic chemotherapy is beneficial for patients with metastatic pancreas cancer with good PS and adequate organ function
  - Germline testing is recommended in patients with pancreas ca
  - Somatic/tumor NGS testing should be performed in advanced/metastatic patients that are candidates to receive systemic therapy
  - Targeting actionable mutations may lead to significant benefit (including survival and QOL benefits)
-

# **Biliary Cancer**

# Prospective, National, Multicenter Phase 3 Study: ABC-02 Schema

Eligible patients (n = 400<sup>a</sup>)

+ QoL

Randomized 1:1

(stratified by center, primary site, PS, prior therapy and locally advanced vs metastatic)

**Arm A**

**Gem 1000 mg/m<sup>2</sup>**  
*D1,8,15 q 28d*  
24 weeks (6 cycles)

**Arm B**

**Cisplatin 25 mg/m<sup>2</sup>**  
**+ Gem 1000 mg/m<sup>2</sup>**  
*D1,8 q 21d*  
24 weeks (8 cycles)

**Primary endpoint OS**

## Inclusion criteria:

- Histologically / cytologically verified, non-resectable or recurrent/metastatic CCC, GB, or ampullary carcinoma
- Adequate biliary drainage, no uncontrolled infection
- ECOG PS 0-2
- LFTs: bilirubin  $\leq 1.5 \times \text{ULN}$ , ALT/ AST/ alk phos  $\leq 3 \times \text{ULN}$  ( $\leq 5$  if liver metastases)
- No prior systemic treatment<sup>b</sup>
- Consenting informed-patients

<sup>a</sup> Including 86 patients in ABC-01.

<sup>b</sup> Allowed: palliative surgery, relapse following curative surgery, PDT, radiotherapy with documented progression.

# Targets

- Specific
  - IDH-1 mutations
  - FGFR2 fusions
  - BRAF
  - Her-2
- Tumor agnostic
  - NTRK fusions
  - MMR-deficiency

IDH-1

# Ivosidenib Phase 1 and Phase 3 Studies

## Phase 1 Study

CCA, chondrosarcoma, glioma, others  
[NCT02073994]

**CCA cohort<sup>1</sup>:** n = 73 [dose escalation (n = 24);  
dose-expansion 500 mg QD  
(n = 49)]

No DLTs; drug-related AEs: fatigue, nausea,  
diarrhea, vomiting

### Activity:

Median PFS 3.8 months

6-month PFS: 40.1%

12-month PFS: 21.8%

RR 5% (4 PRs)

OS: 13.8 m

## Phase 3 Study (ClarIDHy)

Second-line, placebo- controlled  
[NCT02989857]<sup>2</sup>

AG-120 is a first-in-class, potent, oral inhibitor of the mutant IDH1 enzyme

## IDH1 Mutations

IHCCA (22%)

Chondrosarcoma (50%)

Glioma (80%)

Abou-Alfa, GK. Lancet Oncol, 2020

## ClarIDHy: PFS by IRC

NE = not estimable; PR = partial response; SD = stable disease.

- mOS (months; adjusted for cross-over):  
10.8 vs 6 months (9.7 months unadjusted)

Abou-Alfa, GK. Lancet Oncol, 2020

- FGFR2 Fusions

At the time of initial diagnosis, CA19-9 was < 35U/mL in 42.6% of pts.

Bone metastases were observed in 41 (30.6%) pts with advanced disease

# FIGHT-202 STUDY DESIGN

- Phase 2 open-label, single-arm study evaluating the efficacy and safety of pemigatinib in patients with previously treated locally advanced or metastatic CCA (NCT02924376)
  - Sites opened in the United States, Europe, Middle East, and Asia

## FGFR2

- Physiologic roles: cell proliferation, differentiation, migration, angiogenesis
- Approx. 10-15% IHCCA
- FGFR fusions: ligand independent activation of FGFR

## RESULTS

- 56 unique *FGFR2* fusion genes were observed in cohort A (*FGFR2* fusions or rearrangements).
- In cohort A, pemigatinib treatment resulted in
  - ORR of 35.5% with durable responses
  - Median PFS of 6.9 months
- A phase 3 study is ongoing in the first-line setting to evaluate pemigatinib versus gemcitabine plus cisplatin in patients with CCA and *FGFR2* fusions or rearrangements (NCT03656536)

## Phase II study of infigratinib cholangio *FGFR2* gene fusion/rearrangement

- 108 pts advanced/metastatic CCA post  $\geq 1$  line of systemic therapy
- Infigratinib 125 mg orally for 21 days of each 28-day cycle
  - ORR 23.1% (1 CR/24PRs). DOR 5 months
  - TEAEs any grade: hyperphosphatemia (76.9%), eye disorders (67.6%), stomatitis (54.6%), and fatigue (39.8%).
- A phase III infigratinib versus gem/DDP is ongoing in the front-line setting

# Other FGFR Inhibitors in Development

- **Futibatinib (TAS-120):** irreversible FGFR1–4 inhibitor
  - RR 41.7% (FGFR2 fusion)
  - Duration of response 9.7 months AND mPFS was 9.0 months
- **Derazantinib; ARQ 087**
  - RR 20.7%
- **ICP-192 (gunagratinib)**
  - Preclinical studies demonstrated potential to overcome resistance to first generation agents

## The Phase 2 Dabrafenib and trametinib: BRAF V600E-mutated BTC Rare Oncology Agnostic Research (ROAR) basket trial

- *BRAF* mutations have been reported in approximately 5%-7% of iCCAs; these mutations may be enriched in iCCA vs other types of biliary cancers
- **Phase 2 study in 43 pts**
  - **ORR 47% (95% CI, 31–62)** – central review
  - Duration of response: 9 months (95% CI, 6–14)
  - PFS: 9 months (95% CI, 5–10)
  - OS: 14 months (95% CI, 10–33)

Subbiah V, et al. *Lancet Oncol.* 2020;21:1234–43.

# Targeting HER-2

- **Pertuzumab and trastuzumab: phase 2a study**
  - 39 patients previously treated HER2 amplification, HER2 overexpression, or both
  - RR 23 %
- **Zanidatamab – HER-2 bispecific antibody**
  - 20 patients (11 gallbladder cancers, 5 intra- and 4 extra-hepatic cholangiocarcinoma)
  - RR 47%; median duration of response 6.6 months
- **Neratinib, a pan-HER irreversible tyrosine kinase inhibitor**
  - 25 pts with activating somatic HER2 mutations (GB 40%, ICC24%, EHCC20%, AV 16%)
  - RR 12% and PFS 2.8 months

Javle Lancet Oncol 2021  
Meric-Bernstam ASCO GI 2021  
Harding et al ASCO GI 2021

# Targeting HER-2

- Trastuzumab deruxtecan
- 30 pts recurrent or unresectable: 22 HER2+(10 IHC 3+ and 12 IHC 2+) and 8 HER2-low (6 IHC 2+ and 2 IHC1+)
- RR 36.4% and 12.5%. PFS 5.1 and 3.2 months
- DOR in Her 2 +: 7.4 months
- ILD:  $\geq$  Grade 3 12.5%

# MSI-High Frequency: Multiple Cancers

Le, D et al. Science, 2017

# Immune Biomarkers in Biliary Cancers

- MMR deficiency
  - KEYNOTE-16: Biliary tract cancers; RR 53%, 21% CR
  - KEYNOTE-158: Cholangiocarcinoma RR 37% (N= 9 )
- Tumor mutation burden (TMB)
  - >10 mutations/Mb 3.5- 5.5% - highest in gallbladder cancer

Le, DT. NEJM, 2015. Silva, VW. CCO, 2016. Lee, H. Ther Adv Gastroenterol, 2017. Diaz, L. ESMO, 2017, Abstr 386P

### PRINCIPLES OF SYSTEMIC THERAPY

#### Primary Treatment for Unresectable and Metastatic Disease

##### Preferred Regimens

- Gemcitabine + cisplatin<sup>4</sup> (category 1)
- Durvalumab + gemcitabine + cisplatin (category 1)<sup>d,e,5</sup>

##### Other Recommended Regimens

- 5-fluorouracil + oxaliplatin
- 5-fluorouracil + cisplatin (category 2B)
- Capecitabine + cisplatin (category 2B)
- Capecitabine + oxaliplatin
- Gemcitabine + albumin-bound paclitaxel
- Gemcitabine + capecitabine
- Gemcitabine + oxaliplatin
- Gemcitabine + cisplatin + albumin-bound paclitaxel<sup>1</sup> (category 2B)
- Single agents:
  - 5-fluorouracil
  - Capecitabine
  - Gemcitabine

##### Useful in Certain Circumstances

- For *NTRK* gene fusion-positive tumors:
  - Entrectinib<sup>6-8</sup>
  - Larotrectinib<sup>9</sup>
- For MSI-H/dMMR tumors:
  - Pembrolizumab<sup>e,f,10,11</sup>
- For *RET* gene fusion-positive tumors:
  - Pralsetinib (category 2B)<sup>12</sup>
  - Selpercatinib for CCA (category 2B)<sup>13</sup>

#### Subsequent-Line Therapy for Biliary Tract Cancers if Disease Progression<sup>9</sup>

##### Preferred Regimens

- FOLFOX<sup>14</sup>

##### Other Recommended Regimens

- FOLFIRI<sup>15</sup> (category 2B)
- Regorafenib<sup>16</sup> (category 2B)
- Liposomal irinotecan + fluorouracil + leucovorin (category 2B)<sup>17</sup>
- Durvalumab + gemcitabine + cisplatin (category 2B)<sup>e,h,5</sup>
- See also: Preferred and Other Recommended Regimens for Unresectable and Metastatic Disease above

##### Useful in Certain Circumstances

- For *NTRK* gene fusion-positive tumors:
  - Entrectinib<sup>6-8</sup>
  - Larotrectinib<sup>9</sup>
- For MSI-H/dMMR tumors:
  - Pembrolizumab<sup>e,f,10,11</sup>
  - Dostarlimab-gxly<sup>e,h,i,18,19</sup> (category 2B)
- For TMB-H tumors:
  - Pembrolizumab<sup>e,f,h,20</sup>
- For *BRAF*-V600E mutated tumors
  - Dabrafenib + trametinib<sup>21,22</sup>
- For CCA with *FGFR2* fusions or rearrangements:
  - Pemigatinib<sup>23</sup>
  - Infigratinib<sup>24</sup>
  - Futibatinib<sup>25</sup>
- For CCA with *IDH1* mutations
  - Ivosidenib<sup>26,27</sup>
- For *RET* gene fusion-positive tumors:
  - Selpercatinib for CCA<sup>13</sup>
  - Pralsetinib (category 2B)<sup>12</sup>
- For HER2-positive tumors:
  - Trastuzumab<sup>j</sup> + pertuzumab<sup>28</sup>
  - Nivolumab<sup>e,h,29</sup> (category 2B)
  - Lenvatinib + pembrolizumab<sup>e,h,30</sup> (category 2B)

<sup>d</sup> Durvalumab + gemcitabine + cisplatin is also a recommended treatment option for patients who developed recurrent disease >6 months after surgery with curative intent and >6 months after completion of adjuvant therapy.

<sup>e</sup> See [NCCN Guidelines for Management of Immunotherapy-Related Toxicities](#).

<sup>f</sup> There are limited clinical trial data to support pembrolizumab in this setting. Sicklick JK, Kato S, Okamura R, et al. Molecular profiling of cancer patients enables personalized combination therapy: the I-PREDICT study. *Nat Med* 2019;25:744-750.

<sup>g</sup> Treatment selection depends on clinical factors including previous treatment regimen/agent and extent of liver dysfunction.

<sup>h</sup> For patients who have not been previously treated with a checkpoint inhibitor because there is a lack of data for subsequent use of immunotherapy in patients who have previously been treated with a checkpoint inhibitor.

<sup>i</sup> Dostarlimab-gxly is a recommended treatment option for patients with MSI-H/dMMR recurrent or advanced tumors that have progressed on or following prior treatment and who have no satisfactory alternative treatment options.

<sup>j</sup> An FDA-approved biosimilar is an appropriate substitute for trastuzumab.

**Note:** All recommendations are category 2A unless otherwise indicated.

**Clinical Trials:** NCCN believes that the best management of any patient with cancer is in a clinical trial. Participation in clinical trials is especially encouraged.
